

Figure S1. Growth competition assays between recombinant HIV-1 variants containing RT mutations M41L/H208Y/L210W/T215Y (open circles) and M41L/L210W/T215Y (closed circles) carried out in the absence of drug. Viruses were mixed at initial ratios of 80:20 (A), 50:50 (B) and 20:80 (C), and the proportion of each variant was determined at days 7, 14, 21 and 28. The error bars represent the standard error of three independent experiments.
